Foreword

With this volume The Metallurgical Society of AIME has been able to bring its publication of *Transactions* to a current basis. A minimum of six months is still needed for review and publication but the rate of input and output are now in relative balance.

Although the field of metallurgy has been influenced and stimulated by broadening technological demands in certain special areas, wholesome balance has been maintained in the papers comprising this volume, and there is no noteworthy change in emphasis from earlier editions. This collection of research papers could be considered as representing normal progress and, while no startling breakthroughs are apparent, many lasting and substantial contributions to the field of metallurgy are included. It is gratifying to note the number of papers by foreign authors, giving an international flavor to this publishing effort.

The professional prestige and stature of the *Transactions* is attributable to the fine cooperation of Metallurgical Society Publications Committees and their careful reviewing of all material submitted. Eliminating the considerable backlog of prior years is a real accomplishment and it is encouraging, also, to note that the continuing availability of many high-quality papers gives a favorable outlook for future volumes.
